

UPPER POND
Lincoln Twp., Penobscot Co.
U. S. G. S. Winn, Me.

Fishes

Brook trout (squaretail)	Minnows
White perch	Blacknose dace
Yellow perch	Common shiner
White sucker	Golden shiner
Hornpout (bullhead)	Ninespine stickleback
Eel	Pumpkinseed sunfish
	Yellowbelly sunfish

Physical Characteristics

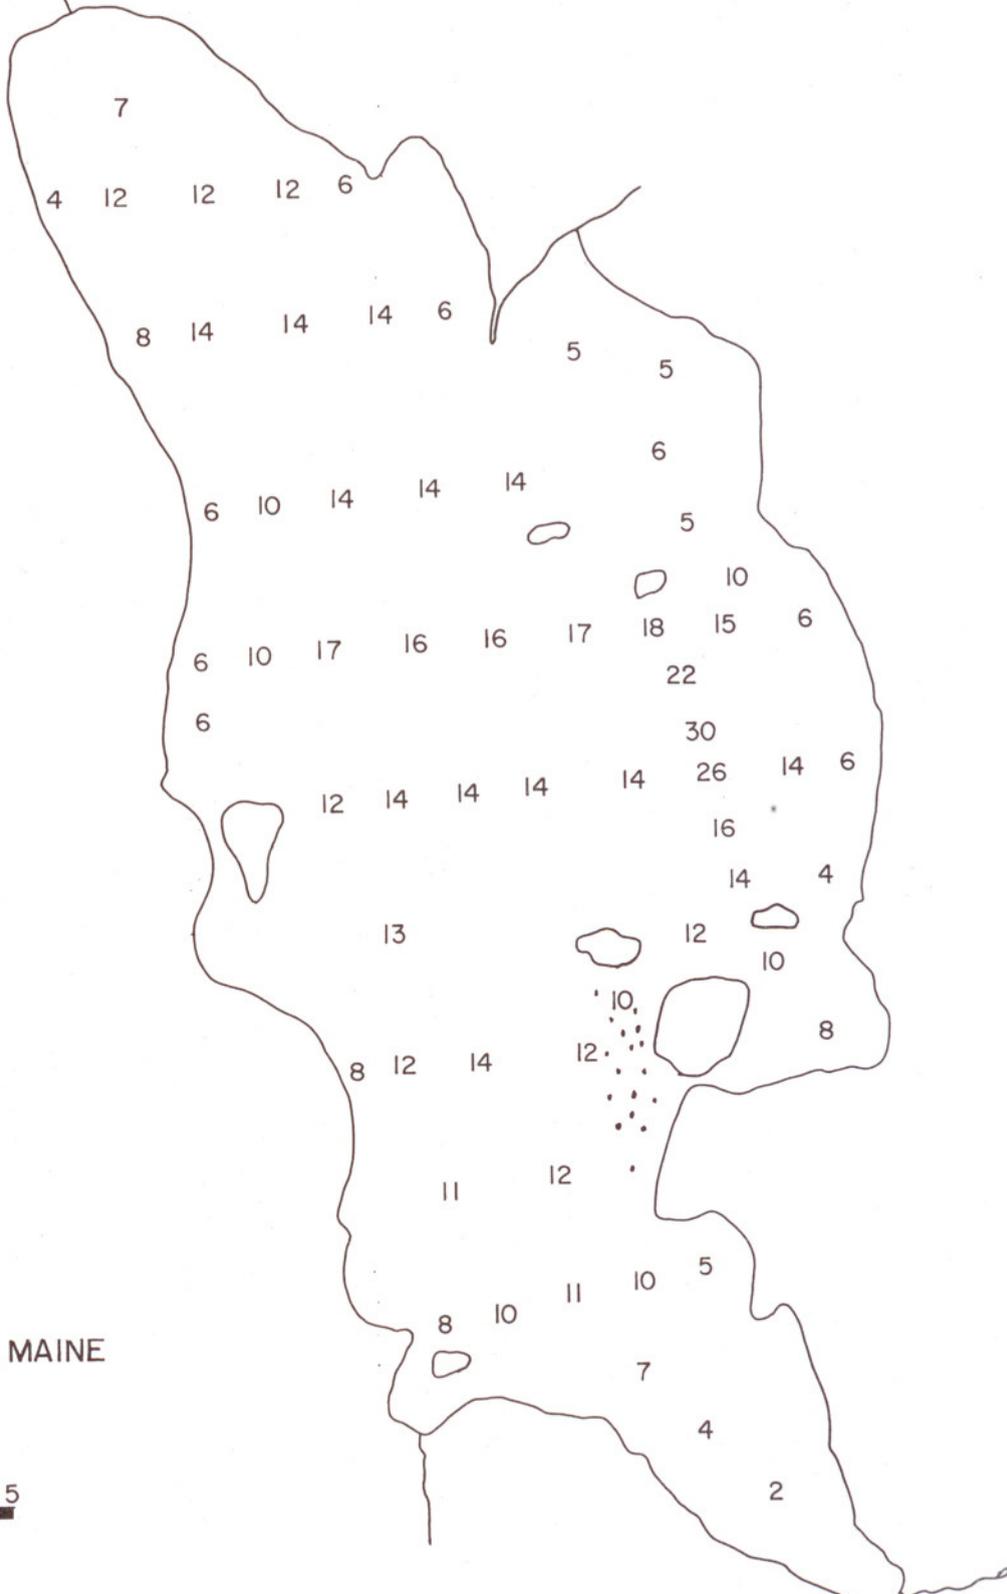

Area - 506 acres	Temperatures
	Surface - 77° F.
Maximum depth - 31 feet	31 feet - 57° F.

Upper Pond should be managed for its thriving population of white perch. The warm, shallow waters are well suited for this species, and growth and reproduction appear to be good.

A small trout fishery can undoubtedly be expected. Sucker Brook, one of the major tributaries, has excellent spawning and nursery area for brook trout and a sizeable trout population. Trout are certain to move into the pond from the stream each year. Only a small population can be expected to occupy the lake on a year-around basis however, because of the shortage of cool, well-oxygenated water, and the abundance of warm-water species.

No stocking of any kind is recommended.
